Test Case: Failed Sign In Due to Incorrect Password

Steps:
1. Set up a mock Chrome selenium driver for the Mint.com login page.
2. Pass an invalid password (incorrect for the given email) to sign_in.
3. Set mfa_method=None and mfa_token=None.
4. Observe/log exceptions or errors raised.

Expected:
- sign_in raises RuntimeError with the message indicating 'Login to Mint failed: incorrect password'
- No further steps (such as MFA or sync) are taken
- No code is retrieved from email, IMAP is not accessed
- Proper logging of any issues leading up to the password failure

---Extra Details---
Filename: signIn.py
Description: Verifies the function identifies a bad password and raises the correct error early, before MFA or sync logic is triggered
Score: 98%
Alignment: 95%
Validation Notes: Directly exercises the password error identification codepath in handle_login_failures.
